FISH Technologist, Clin-Path Diagnostics, LLC, Tempe, AZ

Our lab has been using CytoBond Sealant for over a year now and our techs love it. Only two months after trying it, we completely replaced our rubber cement with CytoBond. We use it with blood, bone marrow and FFPE samples with Abbott probes.

Everyone in the lab likes it because of its ease of use. We apply it to the coverslips using the 100 ml bottle's adjustable applicator tip instead of loading syringes of rubber cement.

Since CytoBond does not require humidity we have eliminated the hassle and mess of using wet channel cards on our ThermoBrite instrument. CytoBond stays moist and supple even in Arizona's dry and arid climate — no more scraping sealant off piece by piece like we used to do with rubber cement. When we return the next day it comes off easily. We really enjoy it!
